ABSTRACT: The **circadian** rhythms are daily oscillations in various biological processes that are regulated by an endogenous clock. Disruption of these rhythms has been associated with **cancer** in humans, One of the cellular processes that is regulated by **circadian** rhythm is cell proliferation, which often shows asynchrony between normal and malignant tissues. This asynchrony highlights the importance of the **circadian** clock in tumour suppression in vivo and is one of the theoretical foundations for **cancer** chronotherapy. Investigation of the mechanisms by which the **circadian** clock controls cell proliferation and other cellular functions might lead to new therapeutic targets.
